

Salesforce Integration

- Setup developer salesforce account.
- Create a custom object emp_profile with fields emp_phone, emp_email, emp_skills.
- Work with salesforce create integration.
- Work with salesforce query operation to fetch object.
- Work with salesforce streaming.

1. Go to salesforce > object manage > New >

New Custom Object

Permissions for this object are disabled for all profiles by default. You can enable object permissions in permission sets or by editing custom profiles. [Tell me more!](#) [Don't show this message again](#)

Step 2: Enter the details

Field Label:

Length:

Field Name:

Description:

Help Text:

Required: ☐ Always require a value in this field in order to save a record

Unique: ☐ Do not allow duplicate values

☐ Treat "ABC" and "abc" as duplicate values (case insensitive)

☐ Treat "ABC" and "abc" as different values (case sensitive)

External ID: ☐ Set this field as the unique record identifier from an external system

Auto add to custom report type: ☒ Add this field to existing custom report types that contain this entity

Default Value:

Show Formula Editor

3. Create another fields too.
4. We created the object with fields
5. To easy access, add object into tab. Go to Home > search and type tab > click on custom object tabs

SETUP

Tabs

Custom Tabs

You can create new custom tabs to extend Salesforce functionality or to build new application functionality.

Custom Object tabs look and behave like the standard tabs provided with Salesforce. Web tabs allow you to embed external web applications and content within the Salesforce window. Visualforce tabs allow you to embed V components to the navigation menu in Lightning Experience and the mobile app. Lightning Page tabs allow you to add Lightning Pages to Lightning Experience and the mobile app.

To insert entry. Click on new and enter details

salesforce create integration with mulesoft:

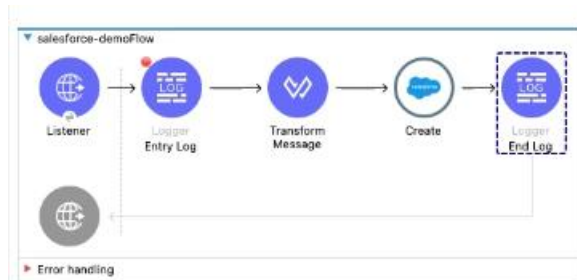

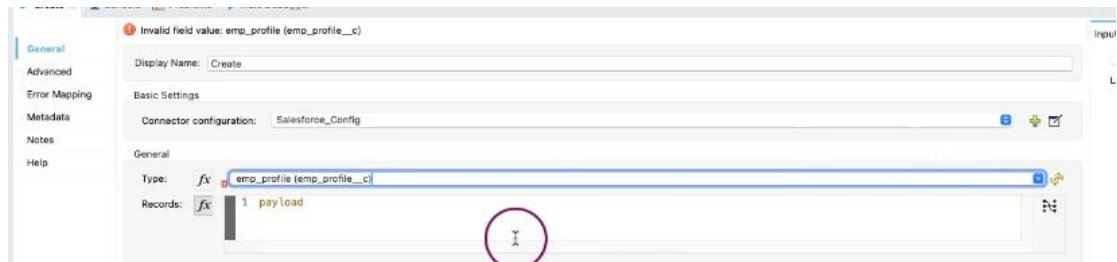

We need security token. Go to salesforce > profile > my settings > personal > reset my security token >

Security token will come to email.

>> while config in mule studio. We need to use this token. After config all salesforce object sync with studio, then we can see all in Type section

Type -- our object in salesforce

Through transform message connector, we insert records. Through payload.

Upsert option:

If the name is already present then it will update it, if name is not there, then it will insert new record

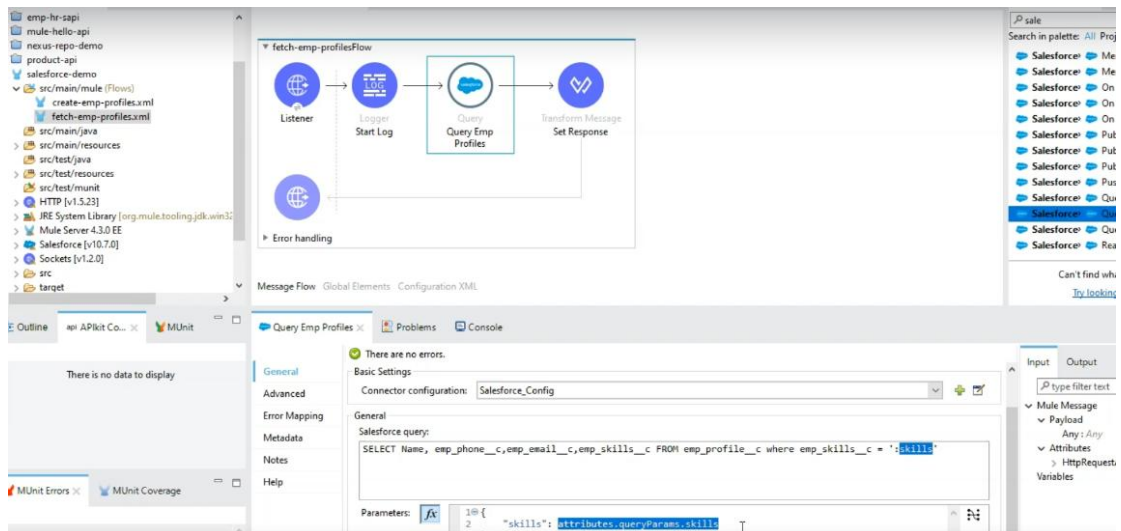

Salesforce query operation to fetch data:

SOQL language is used in this, it is similar to SQL

>>> it will fetch the data from salesforce, who has skills, which we will pass through queryparams

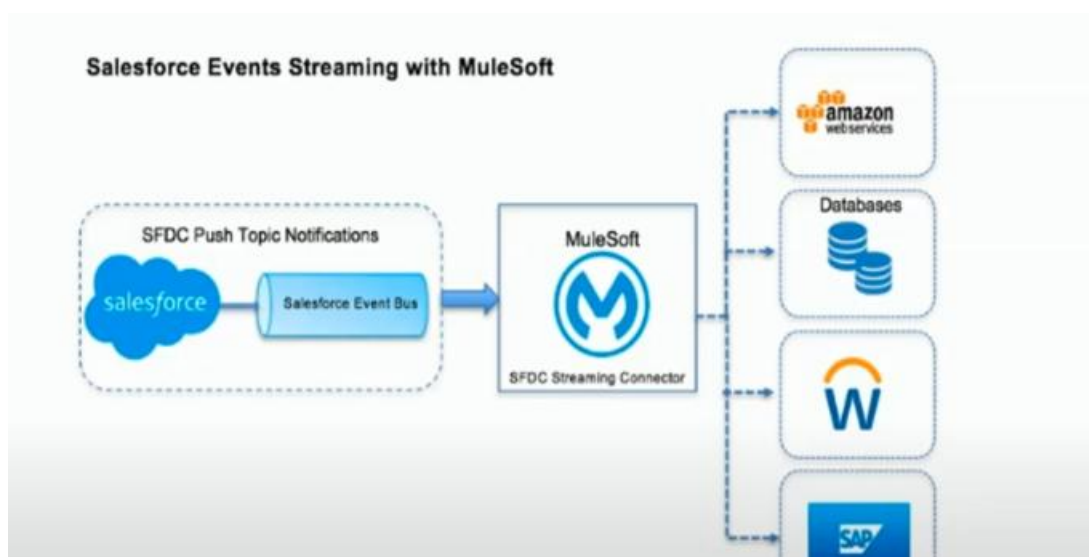

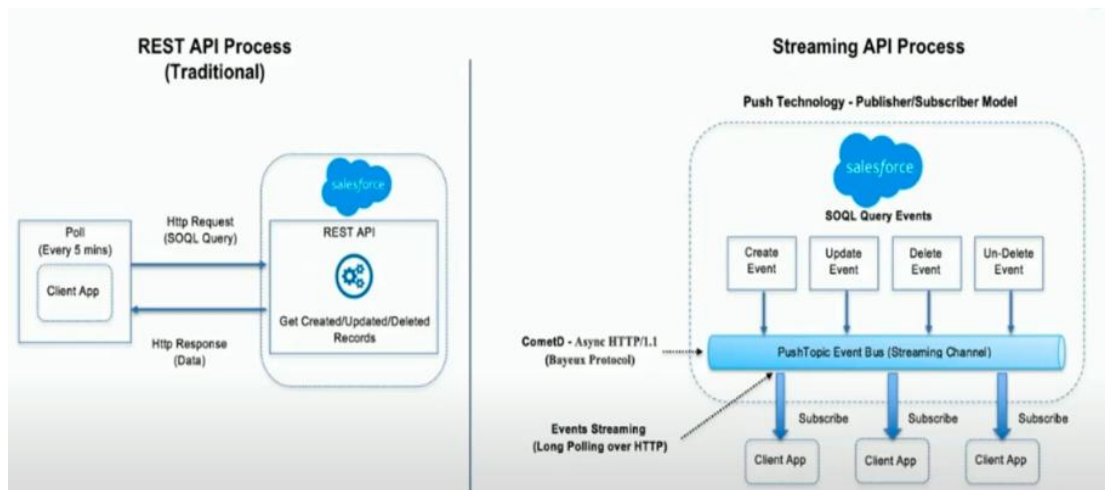

Skills= mule

In transform message, it will transform into required format

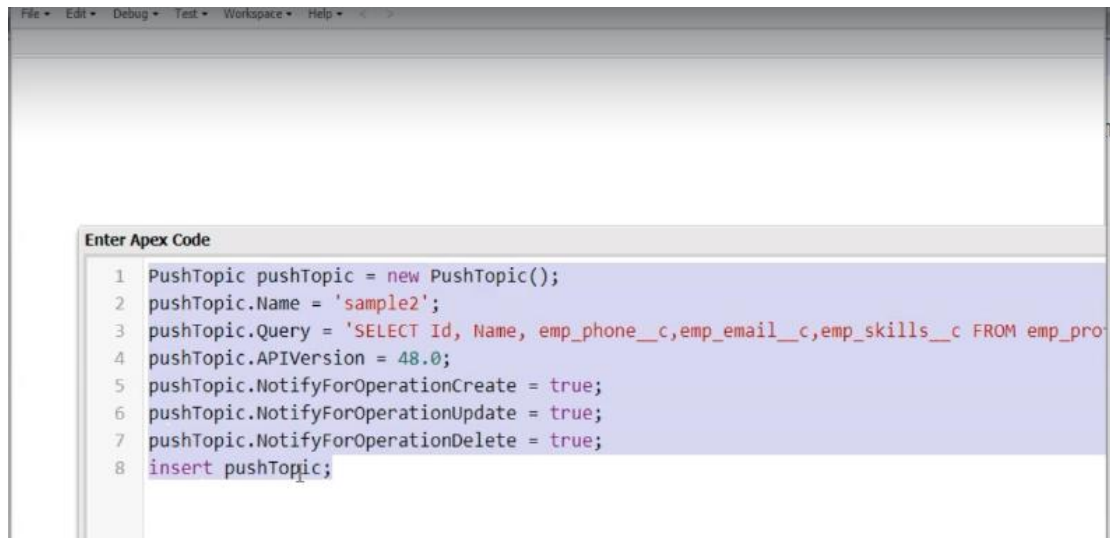

Salesforce streaming:

Streaming: sync data b/w one target to other target

Salesforce topic:

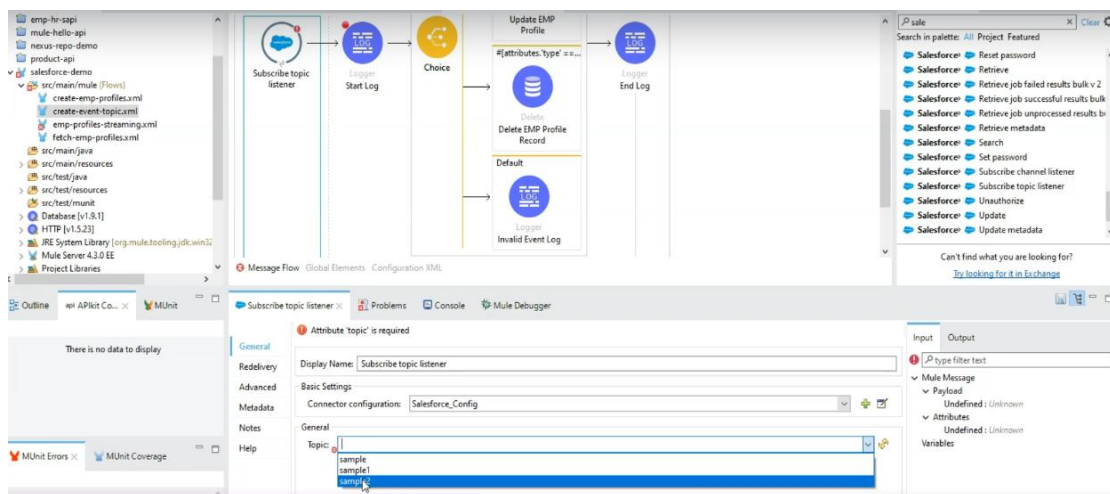

Go to salesforce > profile > Developer console > Debug > open execute anonymous window > it will show apex code

```
1 PushTopic pushTopic = new PushTopic();
2 pushTopic.Name = 'sample2';
3 pushTopic.Query = 'SELECT Id, Name, emp_phone__c,emp_email__c,emp_skills__c FROM emp_pro';
4 pushTopic.APIVersion = 48.0;
5 pushTopic.NotifyForOperationCreate = true;
6 pushTopic.NotifyForOperationUpdate = true;
7 pushTopic.NotifyForOperationDelete = true;
8 insert pushTopic;
```

It will trigger when create, update, delete happens in emp_profile. And save into Topic

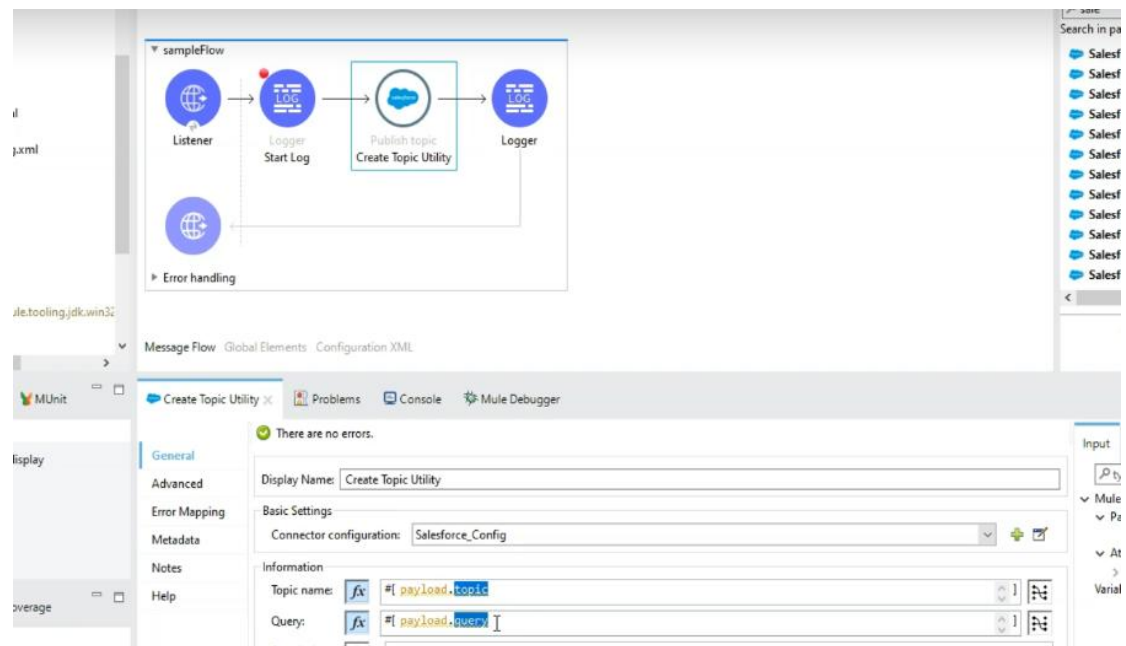

It create a topic in salesforce in name of sample 2.

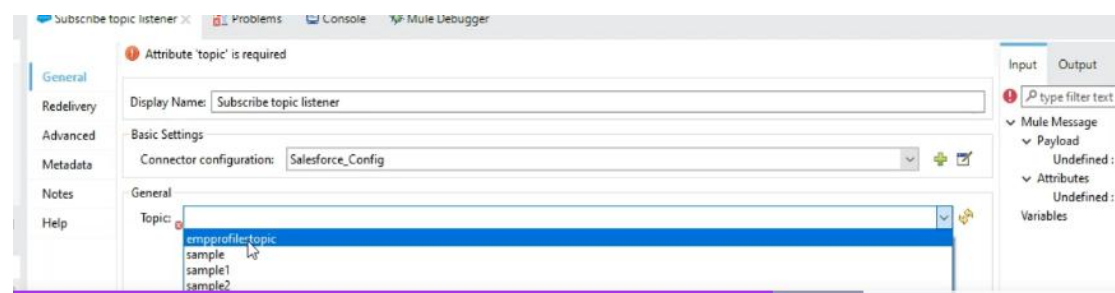

Another way to create topic: (publish topic connector)

We will send name and query through postman.

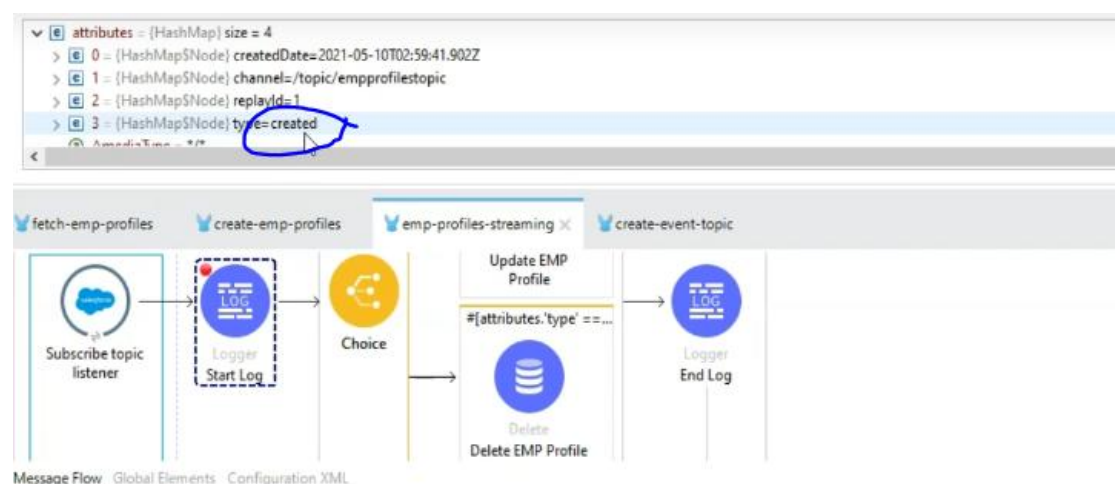

It will automatically select the create, delete, update function,

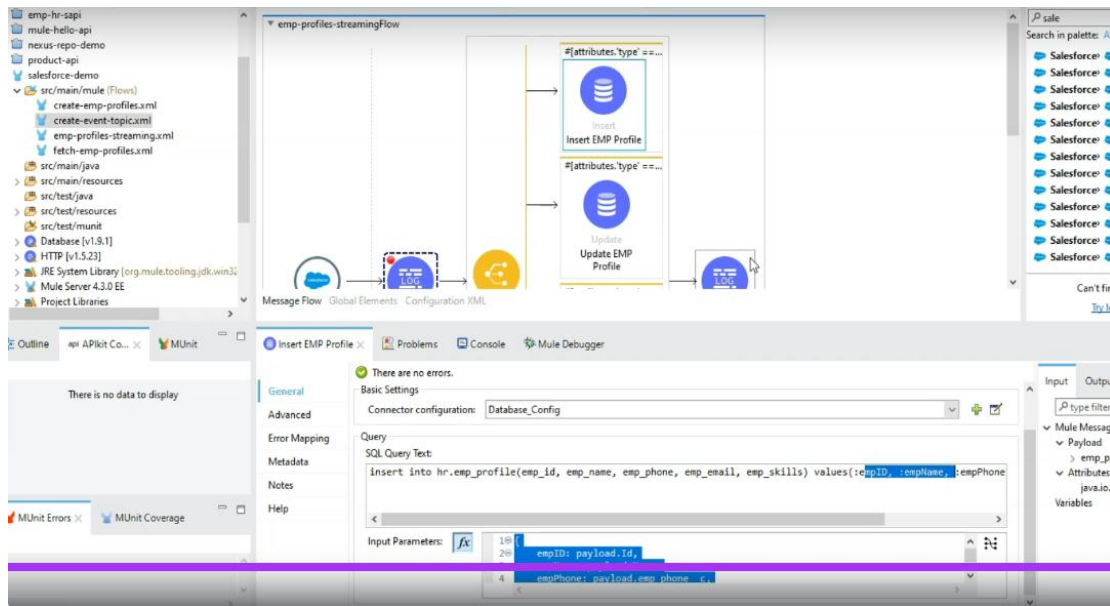

Whenever we add employee in salesforce, it will trigger studio code.

How it will know is it create, delete, update?

Based on this we will add choice connector.

If attributes. Type== created then insert record in DB

In the same way for update and delete.
