

EXTERNALIZING AND SECURING PROPERTIES

Put all passwords in a properties yaml file

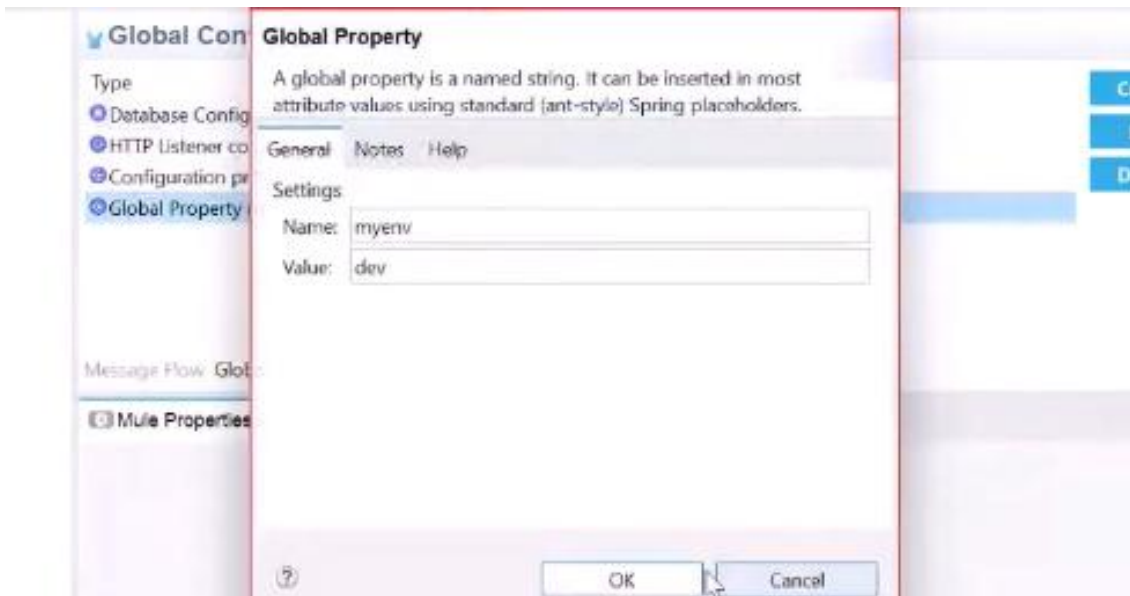

We need to tell which file to get for properties

Go to global.xml > click on global elements > create > search for configuration properties

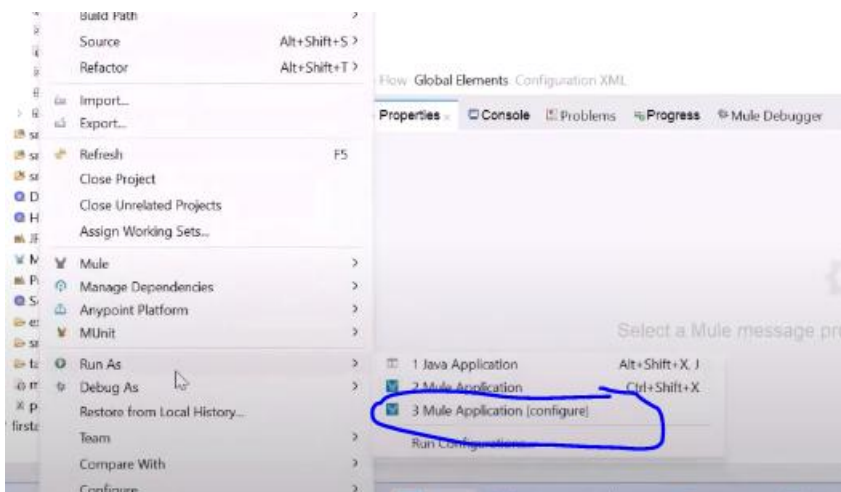

To run particular env:

Go to global.xml > click on global elements > create > search for global property

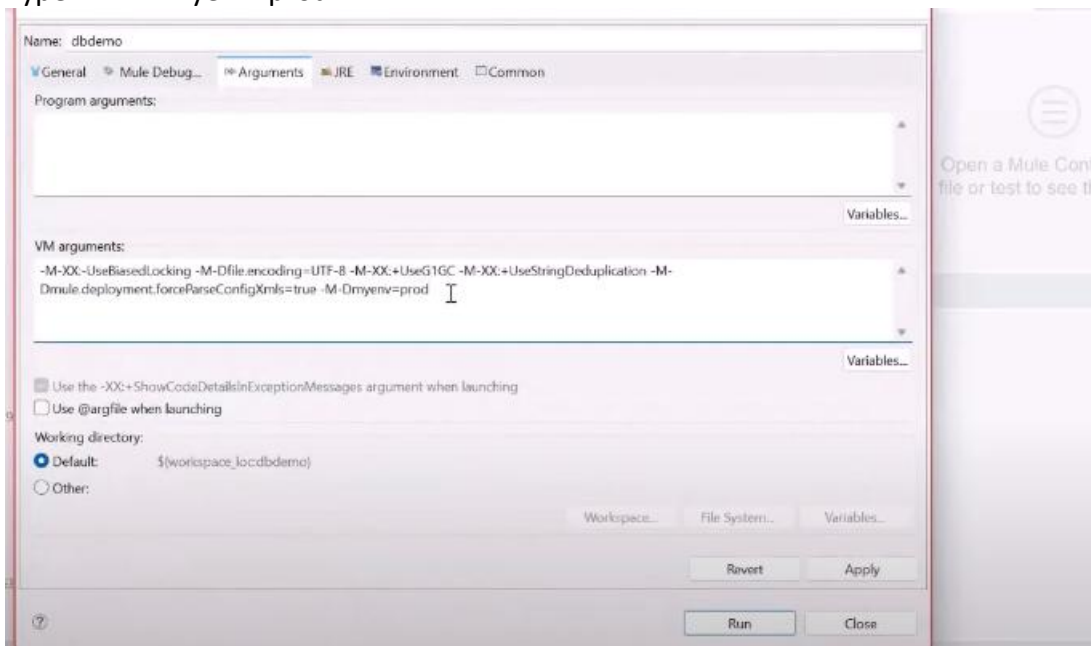

If we want to run on prod env while deploying, we can override it.

Right click on project > run as > mule application configure

Click on arguments

Type : -M -Dmyenv=prod

Encrypt password:

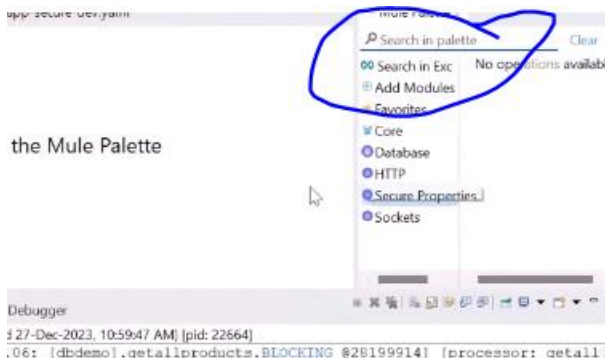

Link : <https://docs.mulesoft.com/mule-runtime/latest/secure-configuration-properties>

We can encrypt single word or file

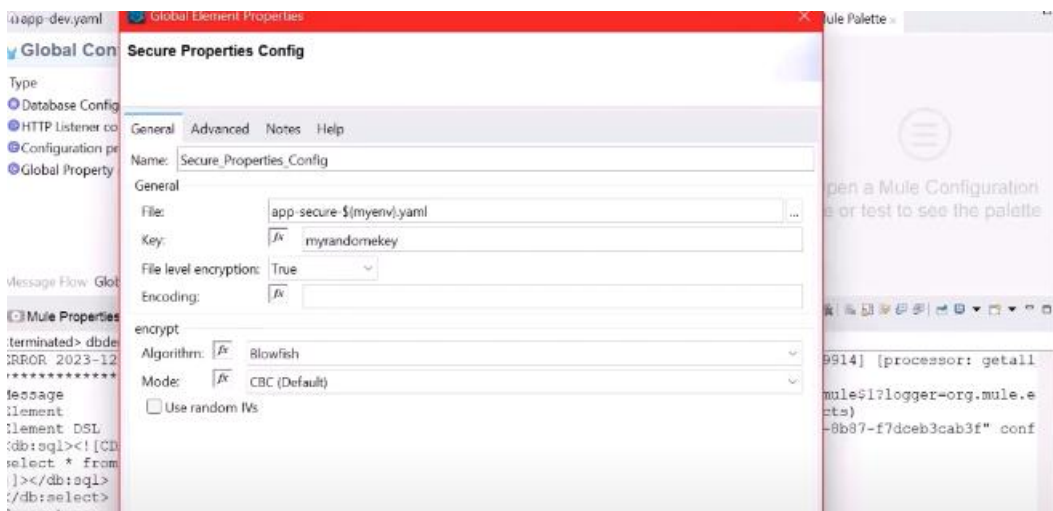

>> by using command prompt

To read secure properties file:

Go to search in exchange > search secure property config > install

>> Go to global.xml > global elements > create > search secure property config

For database config we need to put "secure::"
